Make calculations on the Pandas
DataFrame.

The DataFrame is called self.df.
The column names are the names of
the x, y, and y2 variables without (size,
datatype).
The calculations can have multiple
lines and can be complex.

The example of calculating daily means
is preset for an easier start to write own
calculations.

Manipulate DataFrame

```
# Example daily mean if datetime index
self.df = self.df.resample('1D').mean().squeeze()
```

Cancel calculations
